

COSC 362 Git Assignment 1

Francis Bell

September 10, 2020

To start off this assignment, I first created a repository on GitHub titled "cosc362." On my personal linux machine, I used the git command:

```
"git clone https://github.com/fbell884/cosc362.git"
```

This then brought a folder into my git repository. I went into savage and did the same thing.

I then switched back to my personal machine and created a LaTeX document as a test (test1.tex).

```
"vim test1.tex"
```

```
"*editing file*"
```

```
"pdflatex test1.tex"
```

Next, I used git commands to add, commit and push my changes to the remote repository:

```
"git add test1.pdf"
```

```
"git commit -m "Test Commit""
```

```
"git push origin master"
```

After this, I verified on GitHub that the file was there. Now I went back into savage to pull the changes:

```
"cd cosc362"
```

```
"git pull origin master"
```

The "test1.pdf" file was now on the savage server in the local git repository.

Now that I verified that this works, I have created a new LaTeX document to document my process. I am currently editing this and then I will repeat the steps above to pull this document from savage onto my personal linux machine:

```
"vim gitassignment1.tex"
```

```
"*editing file*"
```

```
"pdflatex gitassignment1.tex"  
"git add gitassignment1.pdf"  
"git commit -m "Committing First Git Assignment""  
"git push origin master"  
*Switching back to Personal Machine*  
"cd cosc362"  
"git pull origin master"
```

Now the file for the assignment that I am working on right now in savage,
is now pulled on to my personal machine.
